Connecting to Wireless Using Windows 10

Operating System Requirements

We highly recommend that you have the most recent updates for your operating system. You can run Windows Update from within the Control Panel.

Wireless Card Requirements

WPA Certified Wireless card

Procedure

Note: These directions reflect what is seen when Windows is managing the wireless connections. If another program (e.g., Intel and/or IBM/Lenovo often provides an applications to manage wireless connections which may override default Windows wireless management) is managing your wireless settings, what you see on your screen will look different from what is shown here. The basic settings will remain the same, but you may need to examine the applications on your system tray (lower-right down by the date/time) to see if any other applications are managing your wireless connections.

1. Click on the wireless icon in your system tray. It should tell you that connections are available.

2. Anyone with a Dickinson network account (Faculty, Staff, Students and Alumni) should choose “Dickinson”. For guests who do not have a Dickinson account, click here for Guest Registration. Click Connect:
3. Enter your Dickinson username and password (NOTE: you may need to type \fas\ before your username - e.g., FAS\username), click OK:

4. You should then see that your laptop is connected next to the network you selected.
